

CRDC Rare Disease Portal reframe 구조 ERD

후보 페이지는 기본 페이지와 같은 fixture를 쓰되 정보 계층만 재구성

Reframe page relationships

From	To	Relation	Purpose
krFront_reframe	krSample_reframe	sample_id route	start sample-centered candidate layout
krFront_reframe	krPhenotype_reframe	query route	start searched HPO profile layout
krFront_reframe	krVariant_reframe	query route	start carrier/gene evidence layout
ReframeContextControl	all reframe pages	context status + editor	global HPO context, not page header status
base mockData + generated JS	sample/phenotype/variant reframe	shared state import	same data as original pages, different information hierarchy

Evidence-layer relationships

Layer	Displayed in	Meaning	Rule
Primary CRDC internal	all reframe result pages	sample HPO, carrier HPO, recurrence, groups	highest priority evidence layer
Core rare disease reference	sample/phenotype/variant reframe	Orphanet, HPO, OMIM disease/gene profiles	reference support, not diagnosis certainty
Secondary annotation	candidate gene/variant areas	PanelApp, Reactome, WikiPathways	badge only; do not hide uncurated CRDC candidates
Active context	sample/phenotype/variant reframe	HPO context compared to sample/carrier/disease HPO	keep separate from genotype recurrence
